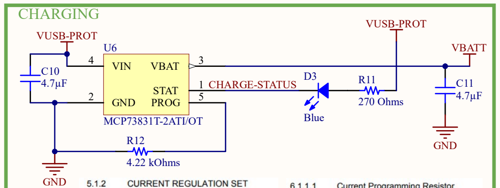
	Description: It's RC Cars that play Laser Tag! totally home made, totally 3D printer, totall cool tell your friends	



5.1.2 CURRENT REGULATION SET (PROG)

Fast charge current regulation can be scaled by placing a programming resistor (R_{PROG}) from the PROG input to V_{SS}. The program resistor and the charge current are calculated using the following equation:

$$I_{REG} = \frac{1000\,V}{R_{PROG}}$$

Where:

R_{PROG} = kOhms
I_{REG} = milliampere

The preconditioning trickle charge current and the charge termination current are ratiometric to the fast charge current based on the selected device options.

6.1.1.1 Current Programming Resistor (R_{PROG})

The preferred fast charge current for Lithium-Ion cells is at the 1C rate, with an absolute maximum current at the 2C rate. For example, a 500 mAh battery pack has a preferred fast charge current of 500 mA. Charging at this rate provides the shortest charge cycle times without degradation to the battery pack performance or life.

Rprog of 4.22kOhms gives us a charge rate of 240mA, the supposed minimum of our battery is 200mA. Lower is healthier.
